

CLINICAL CASE STUDY REPORT

AI Case Study Generator | Generated: 16 May 2026 19:35

PATIENT INFORMATION

Age:	55
Gender:	Female
Marital Status:	Married
Occupation:	Housewife
Address:	Rawalpindi
Mode of Admission:	OPD

PRESENTING SYMPTOMS / CHIEF COMPLAINT

- The patient is a 55-year-old female presenting with right-sided neck pain and stiffness for the last one month. The pain aggravates with neck rotation and looking up, and is relieved by resting and hot pack application. There is no history of trauma or sudden jerk. The patient's past medical history reveals mild hypertension.
- On examination, the patient is conscious and hemodynamically stable. The vital signs are stable, and the posture is observed to be within normal limits. The systems review does not reveal any significant abnormalities.
- The musculoskeletal and neuro assessment reveals tenderness over the right lower cervical paraspinal muscles on palpation. The neck range of motion is restricted in extension and right rotation due to pain. However, the neuro assessment is intact, with no numbness or pain radiating to the arms, and the reflexes are normal. The gait is observed to be normal.

PAIN ASSESSMENT (NUMERIC RATING SCALE 0-10)

Pain Intensity:  6 / 10

TREATMENT APPLIED

- The patient underwent a physiotherapy session which included heat therapy to relieve pain and reduce muscle spasm, gentle cervical mobilizations to improve the range of motion, and neck isometric exercises to strengthen the neck muscles.

CLINICAL RECOMMENDATIONS & FOLLOW-UP

- The clinical impression is that the patient is suffering from cervical spondylosis with muscle spasm. This condition is characterized by wear and tear of the cervical spine, leading to pain and stiffness in the neck.
- The ongoing treatment plan includes continued heat therapy, gentle cervical mobilizations, and neck isometric exercises. The patient is advised to perform regular exercises at home to improve the range of motion and strengthen the neck muscles. The patient will be reviewed regularly to monitor the progress and adjust the treatment plan as necessary.
