PATIENT INFORMATION

Age: 55

Gender: Female

PRESENTING SYMPTOMS / CHIEF COMPLAINT

- The patient is a 55-year-old female presenting with right-sided neck pain and stiffness for the last 1 month. The pain aggravates with neck rotation and looking up, and is relieved by resting and hot pack application. There is no history of trauma or sudden jerk. The patient's past medical history reveals mild hypertension.
- On examination, the patient is conscious and hemodynamically stable. The vitals and systems review are unremarkable. The posture is observed to be within normal limits, although the patient exhibits restricted neck movements due to pain.
- The musculoskeletal and neuro assessment reveals tenderness over the right lower cervical paraspinal muscles on palpation. The neck range of motion is restricted in extension and right rotation due to pain. The neuro assessment is intact, with no numbness or pain radiating to the arms, and reflexes are normal. The gait is observed to be normal.

PAIN ASSESSMENT (NUMERIC RATING SCALE 0-10)

Pain Intensity:

6 / 10

TREATMENT APPLIED

- The treatment applied during the session included heat therapy to relieve pain and reduce muscle spasm, gentle cervical mobilizations to improve range of motion and reduce stiffness, and neck isometric exercises to strengthen the cervical muscles and improve overall neck function.

CLINICAL RECOMMENDATIONS & FOLLOW-UP

- The clinical impression is that the patient is suffering from cervical spondylosis with muscle spasm, which is causing the neck pain and stiffness. This condition is likely due to degenerative changes in the cervical spine, leading to inflammation and irritation of the surrounding muscles and nerves.
- The ongoing treatment plan includes continued heat therapy, gentle cervical mobilizations, and neck isometric exercises. The patient is advised to continue with these exercises at home to improve neck range of motion, reduce pain and stiffness, and prevent further progression of the condition. Regular follow-up appointments are recommended to monitor the patient's progress and adjust the treatment plan as necessary.

Date of session: 16 May 2026
