

CLINICAL CASE STUDY REPORT

AI Case Study Generator | Generated: 16 May 2026 19:03

PATIENT INFORMATION

Age:	55
Gender:	Female
Marital Status:	N/A
Occupation:	N/A
Address:	N/A
Mode of Admission:	N/A

PRESENTING SYMPTOMS / CHIEF COMPLAINT

- The patient is a 55-year-old female presenting with right-sided neck pain and stiffness for the last 1 month. The pain aggravates with neck rotation and looking up, and is relieved by resting and hot pack application. There is no history of trauma or sudden jerk. The patient's past medical history reveals mild hypertension.
- On examination, the patient is conscious and hemodynamically stable. The vital signs and systems review are unremarkable, with no significant findings reported. The patient's posture is not specifically noted, but the presence of neck pain and stiffness suggests potential alterations in cervical spine alignment and movement patterns.
- The musculoskeletal and neuro assessment reveals tenderness over the right lower cervical paraspinal muscles on palpation. The neck range of motion is restricted in extension and right rotation due to pain. However, the neuro assessment is intact, with no numbness or pain radiating to the arms, and reflexes are normal. The patient's gait is also reported as normal.

PAIN ASSESSMENT (NUMERIC RATING SCALE 0-10)

Pain Intensity: 6 / 10

TREATMENT APPLIED

- The treatment applied during the session included heat therapy to help relieve pain and reduce muscle spasm, as well as gentle cervical mobilizations to improve range of motion and reduce stiffness. Additionally, the patient was instructed in neck isometric exercises to strengthen the cervical muscles and improve overall neck function.

CLINICAL RECOMMENDATIONS & FOLLOW-UP

- The clinical impression is that the patient is suffering from cervical spondylosis with muscle spasm, which is causing the right-sided neck pain and stiffness. This condition is likely contributing to the patient's restricted range of motion and tenderness in the cervical paraspinal muscles.
- The ongoing treatment plan includes continued use of heat therapy, gentle cervical mobilizations, and progression of neck isometric exercises to strengthen the cervical muscles and improve range of motion.

CLINICAL CASE STUDY REPORT
